What is a tida-010025 voltage drop?

The voltage drop measured across the NTC is proportional to IGBT module temperature. The TIDA-010025 design is designed to operate from a DC bus voltage of up to 800-Vdc maximum which covers most of the low-voltage drives with grid voltage input up to 480 VAC. A 2-uF,1.1-kV film capacitor is placed close to the IGBT module DC bus inputs.

How to measure bipolar current in MCU ADC?

The input of the MCU ADC is single ended with a FS input range of 3 V. To measure the bipolar current signal the FS output of the isolated amplifier is mapped to the FS input of the ADC. A difference amplifier is implemented using TLV9064 with a gain of $(3-0.2)/(2 \times 2.05) = 0.6829$.

How does tida-010025 work?

The TIDA-010025 design is designed to operate from a DC bus voltage of up to 800-Vdc maximum which covers most of the low-voltage drives with grid voltage input up to 480 VAC. A 2-uF,1.1-kV film capacitor is placed close to the IGBT module DC bus inputs. This capacitor minimizes the loop area for the high-frequency switching currents.

The working principle of three phase induction motor is a bit different than single phase. As its stator houses three phase winding which are displaced in space by 120 degree, when three phase supply is fed to the stator windings, a rotating magnetic flux (rotating at synchronous speed) is established in the stator. Synchronous Speed, $N_s = 120f / P$
