

How to improve the performance of grid-connected inverters?

The dynamic and steady-state performance of grid-connected inverters is typically closely related to the design of the phase-locked loop (PLL) and the current control loop. Therefore, optimizing the design and control of the PLL and current loop is a crucial approach to enhancing the performance of grid-connected inverters [12,13].

How to suppress oscillation in grid-connected inverter system?

To suppress the oscillation, a control parameters design method of the grid-connected inverter is proposed. Without changing the control method, the proposed control parameters design method can ensure the stable operation of the grid-connected inverter system under the very weak grid condition when the short-circuit ratio (SCR) is 2.

How are control parameters validated in a grid-connected inverter?

The control parameters are validated using the optimized values from Literature, specifically $K_P = 0.2635$ and $K_i = 27.12$. In the block diagram, $G_d(s)$ denotes the modulation signal computation delay component of the grid-connected inverter, where the control delay is characterized as a one-sample delay.

Why do we need performance parameters for grid-connected photovoltaic (PV) systems?

The use of appropriate performance parameters facilitates the comparison of grid-connected photovoltaic (PV) systems that may differ with respect to design, technology, or geographic location.

Is a grid-connected inverter control strategy effective under weak grid conditions?

Finally, a 500-kW current-type grid-connected inverter model was built on a hardware-in-the-loop simulation platform. Through experimental analysis of dynamic and steady-state characteristics, the effectiveness of the proposed control strategy under weak grid conditions and significant grid fluctuations was validated.

Are large-scale grid-connected inverters affecting power grid performance?

With the continuous increase in the penetration of renewable energy, the integration of large-scale grid-connected inverters has created a complex coupling relationship with the power grid, presenting unprecedented challenges to system performance.

Fig. 1 illustrates the topology of the LCL grid-connected photovoltaic inverter, where L_1 represents the bridge arm side inductance, C_f is the filter capacitor, L_2 is the grid side inductance, e_{ma} is the A-phase modulation voltage, v_a is the A-phase grid voltage, and i_g is the grid-connected current.

Because the phase-locked loop (PLL) is one of the main reasons for the weak grid sub-synchronous oscillation of the inverter [2, 3], therefore, it is of great significance to obtain the parameters of PLL to analyse the

operation performance of grid-connected inverter and its ...

Compared to other control methods, in [63], [64], the grid power factor is controlled using a previously calculated and tabulated PWM, and acting on the phase shift between grid voltage and inverter output voltage as a control parameter, The proposed control strategy is capable to control, not only the current injected into the grid, but also ...

The grid-connected inverter is the key to ensure stable, reliable, safe, and efficient operation of the power generation system; the quality of the grid-connected output current waveform directly affects the performance of the entire power generation system.

To achieve optimum performance from PV systems for different applications especially in interfacing the utility to renewable energy sources, choosing an appropriate grid-tied inverter is crucial. ... 50% lesser weight than a grid-connected inverter with a low-frequency transformer, high efficiency due to the absence of transformer losses ...

This paper proposes an innovative approach to improve the performance of grid-connected photovoltaic (PV) systems operating in environments with variable atmospheric conditions. The dynamic nature ...

In this paper, a mathematical analysis is presented to show the effect of grid-connected inverter (GCI) parameters on its emissions in the supraharmonic range. This analysis is extended to explain the effect of asymmetry on the emissions of parallel-connected GCIs on distributed power generation systems. The switching harmonics of a GCI appear as bands ...

The impedance method is a fundamental approach to analyze the small-signal stability of grid-connected inverter systems. Unlike the state-space method, it is not constrained by unknown parameters and structure [5]. Previous research efforts have primarily focused on analyzing the impedance characteristics, leading to the development of comprehensive ...

Shipboard PV power generation systems are typically categorised into three variants based on their operation mode: off-grid [8], grid-connected [9] and off-grid/grid ...

Virtual synchronous generator (VSG) control is an effective way to increase the equivalent inertia of grid connected inverter system and improve the stability of the power grid. However, the influence of this control on the stability of the whole system with time delay and parameter uncertainty should be researched further. In this paper, the state space model of ...

The grid-connected solar PV module approach provides two key control parameters: the NST period (M) and the ST duty ratio (D). From Fig. 2 a, during turn ON period of switch S, the diodes D1 and D5 are under ON state, ...

Considering nonlinear control delays, a parameter design scheme optimized for multiple performance indexes is obtained using the D-partition method. This scheme ensures ...

The test system is described shown in Fig. 13.6, the grid-connected inverter system is simulated using Matlab/Simulink. The simulation model mainly includes the main circuit module and the control module of a three-phase two-level inverter. The grid-connected inverter can distribute the active and reactive power according to the control.

The main focus of the paper is to highlight the importance of PR as a crucial performance indicator citing literature and research progress. In literature review, mainly, we discuss and compare few internationally acclaimed PV monitoring standards, guidelines, expert works and company methodologies, as to how they calculate the PR of a grid connected PV ...

Small-signal stability problems often occur when the inverter for renewable energy generation is connected to weak grid. A small-signal transfer function integrated model reflecting the interaction of grid impedance, phase locked-loop (PLL), and current control loop is established in this paper. Based on the established model, the oscillation mechanism of the grid ...

Consequently, the proposed CCFPIFS can not only achieve better control performance and improve the robustness of the LCL grid-connected inverter system, but also improve the output power quality of the system. This damping strategy can make the LCL grid-connected inverter system work stably under the environment of high grid impedance.

Consequently, the control structures of the grid-connected inverter as an important section for energy conversion and transmission should be improved to meet the requirements for grid interconnection.

The dynamic and steady-state performance of grid-connected inverters is typically closely related to the design of the phase-locked loop (PLL) and the current control loop. ...

Compensated Generalized VSG (CGVSG)-Based GFMI: An advanced VSG variant that incorporates compensation techniques to enhance dynamic performance in both ...

This paper presents an extensive analysis of grid-forming (GFM) inverter technology, essential for reliable operation within power systems dominated by inverter-based ...

According to the PWM modulation theory, the three-phase inverter has a greater harmonic current content at frequency or .Table 1 shows the harmonic current distortion limit IEEE 519-STD, in which the harmonics are 35 times greater than those in a grid-connected system, and the maximum amplitude should not exceed 0.3% of the maximum amplitude of the current [13, ...

The proposed ARPI controller is aimed at regulating the DC link voltage, and consequently reducing the fluctuations resulted from the PV power. The standard test conditions for the grid-connected PV inverter in this paper are 1000 W/m² and 30 °C for irradiance and temperature, respectively [8].

Understanding inverter parameters is essential for better system design and equipment selection, ensuring the efficient operation and maintenance of solar power systems. Therefore, ADNLTITE has meticulously compiled this detailed ...

Passivity-based control (PBC) exhibits robustness against parameters shift, providing a substantial level of stability. However, for the LCL-filtered grid-connected inverter (GCI), the ...

The use of appropriate performance parameters facilitates the comparison of grid-connected photovoltaic (PV) systems that may differ with respect to design, technology, or ...
