Hi Jun, derate is very subjective - here's some reasoning behind it: 1. Generalized Industry Estimates o Many solar designers use a default system derate factor to estimate real-world performance losses, even though actual losses depend on specific site conditions. o Historically, the National Renewable Energy Laboratory (NREL) suggested a default system ...

These factors play a significant role in determining the right inverter size for my setup. To accurately size the inverter, I must calculate the total wattage needed, factoring in both running watts and surge requirements of the devices. Adding a safety margin of 20% ensures that the inverter can handle unexpected power spikes without overloading.

Example: I tell the inverter to charge the batteries at 80A (max inverter settings). The batteries are 50v. This draws 4000W. My PV system is producing 180v, which would require approx. 22A to get to 4000W. Does the inverter know not to cross 18A or will it just pull 22A and risk frying itself? I hope that I communicated the question well enough.
