This switch allows you to feed the main panel from inverter output, or from the other manual switch. Between the two switches, you'd be able to: - disconnect all power - bypass inverters/solar, and feed from grid only - feed from solar. From there, you can print and laminate a simple table, telling the homeowner what switch positions do what:

Any device that runs on batteries is DC powered and can be connected directly to solar power without using an inverter. You can connect a DC load directly to solar panels as there is no need to convert to AC. Digital cameras, drones, TV remote, cell phones, laptops, wall clocks and electric vehicles are some examples.

Types of Inverters. There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

You can't connect a solar panel directly to a battery. Instead, you need to invest in a charge controller to make sure the current and voltage for the battery are at the correct levels. You can connect the solar panels directly to a power inverter and then connect it ...
