PWM control. The inverter outputs a pulsed voltage, and the pulses are smoothed by the motor coil so that a sine wave current flows to the motor to control the speed and torque of the motor. The voltage output from the inverter is in pulse form. The pulses are smoothed by the motor coil, and a sine wave current flows.

operation of inverters with any type of output impedance having a phase angle between $-\pi/2$ rad and $\pi/2$ rad, a universal droop control strategy is presented. The voltage and frequency regulation along with the current limiting are handled together with the power sharing during the development of the droop controller.
