How does an energy storage system work?

Energy Storage: The system features a flywheel made from a carbon fiber composite, which is both durable and capable of storing a lot of energy. A motor-generator unit uses electrical power to spin the flywheel up to high speeds. As it spins, the flywheel accumulates kinetic energy, similar to how a spinning top holds energy.

How does rotation store energy in a flywheel?

The principle of rotating mass causes energy to store in a flywheel by converting electrical energy into mechanical energy in the form of rotational kinetic energy. The energy fed to an FESS is mostly dragged from an electrical energy source, which may or may not be connected to the grid.

What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

How does a flywheel energy storage system work?

Most modern high-speed flywheel energy storage systems (FESS) consist of a huge rotating cylinder supported on a stator (the stationary part of a rotary system) by magnetically levitated bearings. These bearings are permanent magnets which support the weight of the flywheel by repulsion forces and are stabilised with electromagnets.
