

What is a multi-energy complementary system?

Multi-energy complementary systems usually include thermal power (including gas turbine), wind power, solar power (photovoltaic), hydropower, pumped storage and other types of power supply. As a conventional schedulable power source, thermal power can be adjusted to generate a certain peak amplitude, and the output speed is slow.

What are the core modules of a multi-energy complementary system?

For complex multi-energy complementary systems, through the establishment of a system platform for analytical processing and global optimization management, the core modules include forecasting, analysis and decision-making links, grid, renewable energy, non-renewable energy, energy storage systems, and various energy loads.

How can wind-solar complementary power generation be optimized?

In the field of wind-solar complementary power generation, Liu Shuhua et al. developed an individual optimization method for the configuration of solar-thermal power plants and established a capacity optimization model for the integrated new energy complementary power generation system in comprehensive parks .

Does wind and solar multi-energy complementation affect a smart city energy system?

Wind and solar multi-energy complementation has become a key technology area in smart city energy system, but its inherent intermittency and random fluctuations have caused many negative effects on the stable operation of multi-energy system.

What is multi-energy thermo-chemical complementary technology?

Multi-energy thermo-chemical complementary technology refers to the selection of a suitable endothermic chemical reaction to convert thermal energy into fuel chemical energy, improve energy conversion efficiency, and achieve renewable energy storage and transport. The technology is currently in the basic research stage.

What is the integration rate of wind and solar power?

The integration rates of wind and solar power are 64.37 % and 77.25 %, respectively, which represent an increase of 30.71 % and 25.98 % over the MOPSO algorithm. The system's total clean energy supply reaches 94.1 %, offering a novel approach for the storage and utilization of clean energy.

1. Introduction

With the rapid integration of renewable energy sources, such as wind and solar, multiple types of energy storage technologies have been widely used to improve renewable energy generation and promote the development of sustainable energy systems. Energy storage can provide fast response and regulation capabilities, but multiple types of energy storage ...

Multi energy complementarity focuses on achieving multi energy complementarity and integration from the energy supply side, user demand side, and energy transmission and distribution side. ... a total of 17 terminal integrated energy supply systems and 6 wind solar water thermal storage multi energy complementary systems were selected. The six ...

Resource complementarity carries significant benefit to the power grid due to its smoothing effect on variable renewable resource output. In this paper, we analyse literature data to understand the role of wind-solar ...

How to fully utilize the advantages of multiple energy storage and coordinate the multi-energy complementarity of multiple energy storage is the key to maintaining a stable operation of the power ...

The strong stochastic fluctuations of wind and solar power generation (Variable Renewable Energy, VREs) leads to significant challenges in securing generation-load balance for power systems with large shares of VREs [1, 2]. Thanks to the regulation ability of hydropower and the complementarity between hydro-wind-solar multiple energy, the complementary operation ...

A multi-energy complementary system including solar energy, multi-source heat pump, biomass energy, and wind energy is utilized commonly in cooling and heating [4-6], seawater desalination [7], material processing [8], hydrogen production [9], and power generation [10]. Daqing area is rich in solar energy resources.

The move towards achieving carbon neutrality has sparked interest in combining multiple energy sources to promote renewable penetration. This paper presents a proposition for a hybrid energy system that integrates solar, wind, electrolyzer, hydrogen storage, Proton Exchange Membrane Fuel Cell (PEMFC) and thermal storage to meet the electrical and ...

Then, the changes of wind and solar energy complementarity and net load fluctuation are predicted in the 2030s and 2060s under the SSP2-4.5 and SSP5-8.5 scenarios. Overall, climate change is anticipated to have a negative impact on the future complementarity of wind and solar energy.

In the context of carbon neutrality, renewable energy, especially wind power, solar PV and hydropower, will become the most important power sources in the future low-carbon power system. Since wind power and solar PV are specifically intermittent and space-heterogeneity, an assessment of renewable energy potential considering the variability of wind ...

As a key link of energy inputs and demands in the RIES, energy storage system (ESS) [10] can effectively smooth the randomness of renewable energy, reduce the waste of wind and solar power [11], and decrease the installation of standby systems for satisfying the peak load. At the same time, ESS also can balance the instantaneous energy supply and demand ...

High penetration of renewable energy generation is an important trend in the development of power systems. However, the problem of wind and solar energy curtailment due to their inherent randomness and fluctuation remains to be solved. Multienergy complementary operation based on the complementarity between different renewable energy units is an important means to ...

Many previous studies have attempted to explore the complementarity between wind and solar resources in various regions in the world. Jurasz et al. [21] systematically investigated the relevant literature and presented an extensive and exhaustive review of how to quantify complementarity. One of the most popular methods to achieve this is with correlation ...

Accelerating the construction of a new energy system, vigorously advancing the development of renewable energy, and establishing a new complementary electricity system is one of the important measures for green transformation, playing a crucial role in the future energy development. Consequently, this article, targeting the current status of multi-energy ...

of wind energy, solar energy, water energy, coal, natural ... regional thermal energy price regulation, and low-cost commercial fuel cells. Research and development of key ... Energy storage in multi-energy complementary systems include power storage, such as pumped storage, compressed air storage, battery storage. ...

The study of [18] shows the transformative role of multi-energy complementarity in optimizing energy storage and dispatch strategies. Building on this, intelligent control mechanisms can dynamically balance solar, wind, and biogas resources in real-time, leveraging AI-driven predictive analytics to enhance resource allocation, reduce battery ...

Green hydrogen (GH₂) is produced using renewable energy resources (RERs) such as solar photovoltaic (PV) and wind energy. However, relying solely on a single source, H₂ production systems may encounter challenges due to the intermittent nature, time-of-day variability, and seasonal changes associated with these energies. This paper addresses the ...

Consequently, this article, targeting the current status of multi-energy complementarity, establishes a complementary system of pumped hydro storage, battery ...

This paper considers the complementary capacity planning of a wind-solar-thermal-storage hybrid power generation system under the coupling of electricity and carbon cost markets. It proposes a method for establishing ...

Firstly, an integrative renewable energy supply system integrated wind, solar, hydrogen, geothermal and storage energy is designed and proposed to effectively address ...

Regarding the research based on correlation, some different indicators are applied for the quantitative analysis of complementarity. Zhu et al. [22], François et al. [23] studied the output complementarity of a hydro-wind-solar hybrid power system using the Pearson correlation. Li et al. [24] used correlograms, correlation coefficients, and cross-correlation coefficients to ...

The power energy base encompasses multiple wind farms and photovoltaic power stations, complemented by corresponding wind energy storage and solar energy storage facilities. Energy storage is utilized for peak ...

Several studies have investigated the complementary potential of various renewable power sources, including wind power and solar power [17,18], wind -solar power and hydropower [19,20], wind -solar -hydro- thermal power and energy storage [21,22] and so on.

Analysis of the Combination of Indicators for Evaluating the Comprehensive Benefits of Multi-Energy Complementarity 3.1. Analytic Hierarchy Process. ... which is based on ...

The peaking capacity of thermal power generation offers a compromise for mitigating the instability caused by renewable energy generation [14]. Additionally, energy storage technologies play a critical role in improving the low-carbon levels of power systems by reducing renewable curtailment and associated carbon emissions [15]. Literature suggests that ...

The rest of this paper is structured as follows: in Section 2 we start with a clear and updated definition of the "complementarity" concept. In Section 3 we present the historical and geographical overview of the research on the complementarity - simply statistics on complementarity research. In Section 4 we analyze and describe the various metrics used to ...

The proposed approach involves a method of joint optimization configuration for wind-solar-thermal-storage (WSTS) power energy bases utilizing a dynamic inertia weight chaotic particle swarm optimization (DIWCPSO) algorithm. The power generated from the combination of wind and solar energy is analyzed quantitatively by using the average ...

The hydro-wind-PV MECS consists of wind turbines (WT), PV arrays (PVA) and HPS. Wind, PV and hydro output are mainly affected by wind speed, solar radiation intensity and runoff [4]. Accurate prediction of these natural variables can provide a basis for power planning in advance by the dispatching department and reduce disturbances and shocks to the power ...
